

UNITY 6.4

You have an awesome game made in Unity

And you want to release it on the Web

Poki

CrazyGames

Playgama

Facebook

VK

Yandex Games

But the Web builds turn out too heavy

Portals cap uploads, and players leave before the loader finishes.

∞ MB .wasm

∞ MB in memory

ScopeBee

A Web-first engine built for the size the
Web can actually carry — and a converter
that brings your Unity project across.

ScopeBee helps you migrate

Scenes and prefabs

full hierarchy, component data

Code

C# → AST → BeeF

Music, sounds and images

audio clips, textures, sprites

ScriptableObjects

assets and the data they hold

Sprite atlases

packing preserved

THE ENGINE

ScopeBee converts most of your project and runs it as-is

HIERARCHY · SCENE · PROJECT · INSPECTOR · GAME

Same scene tree, same components, same folders – and the game plays.

NUMBERS, NOT PROMISES

The same game, measured

Pixi 8 is a 2D rendering library — renderer, scene graph and asset loader, with no physics, audio or editor. Phaser 4 is a code-only 2D framework with no editor and no 3D pipeline. Both get Box2D here through Planck.js. Hence the smaller runtime download.

Each build made with its engine's own tools, Box2D physics everywhere. Download and unpacked size are the Chrome DevTools Network totals for every file the page fetches, before and after brotli; first frame is the time from opening the page to the first frame the engine draws; memory is a DevTools heap snapshot. One cold load per engine from a local server, browser restarted between engines. Chrome 154, macOS.
